ENSO ADVISORY

El Niño Advisory No. 3

Moderate El Niño is present in the Tropical Pacific. Climate models predict that El Niño will continue until the first half of 2027 and may reach a very strong state before the end of 2026.

El Niño increases the likelihood of below-normal rainfall, which may lead to adverse impacts, including dry spells and droughts in some areas of the country. However, over the western part of the country, above-normal rainfall conditions during the Southwest monsoon season (i.e., *Habagat)* may also occur.

Assessment for July 2026

The weather systems that influenced the weather and climate of the country during the month were the Southwest Monsoon, easterlies, localized thunderstorms, low-pressure areas (LPAs), intertropical convergence zone (ITCZ), ridge of high pressure area (HPA), and the passage of four (4) tropical cyclones (TCs) in the Philippine Area of Responsibility (PAR): Tropical Depression (TD) “Henry” in 01 July, Super Typhoon (STY) “Inday” (BAVI) from 08 to 11 July and Tropical Storm (TS) “Josie” (HAISHEN) from 22 to 25 July, and Typhoon (TY) “Kiyapo” (NOUL).

The rainfall assessment for the month showed that most areas of the country experienced below- to near-normal rainfall conditions. However, patches of above-normal rainfall were observed in Apayao, Cagayan, Bohol, northern parts of Negros Provinces, and most of Mindanao.

In addition, nineteen (19) provinces experienced meteorological drought, most of which were in Luzon; two (2) provinces were under dry spells, and three (3) provinces experienced dry conditions. For a complete list of these provinces, please refer to the meteorological **Drought/Dry Spell Assessment** Maps and Tables.

Slightly above- to above-average mean surface air temperatures were observed over most parts of the country during the month, except for select areas in La Union, Northern Palawan, Bicol, and southern Mindanao where cooler-than-average temperatures were recorded. The recorded temperature ranges were as follows: mountainous areas of Luzon (16.4°C – 26.0°C); Metro Manila (23.4°C – 35.7°C); rest of Luzon (19.7°C – 38.9°C); Visayas (22.4°C – 36.0°C); mountainous areas of Mindanao (18.6°C – 32.8°C); rest of Mindanao (21.7°C – 36.2°C). Meanwhile, the highest maximum temperature record of 36.1°C last July 2023 in Clark, Pampanga was surpassed this year with 36.2°C observed last July 5th.

Outlook for August 2026

The weather systems expected to affect the weather and climate of the country in August are the Southwest Monsoon, easterlies, LPAs, ITCZ, localized thunderstorms, ridge of the HPA, and the occurrence of two (2) to four (4) tropical cyclones (TCs) that may develop within or enter the PAR.

The rainfall forecast for August suggests that above-normal rainfall conditions will be experienced over the western parts of Northern and Central Luzon, and patches of below-normal rainfall are likely over the Bicol Region, Visayas, Caraga, and Zamboanga Peninsula, while near-normal conditions are expected over the rest of the country. This is supported by the probabilistic forecast, suggesting a high chance of above-normal

ENSO ADVISORY

El Niño Advisory No. 3

rainfall in the western parts of Luzon and below-normal rainfall in most parts of Southern Luzon, Visayas, and Mindanao. Based on observed rainfall during the past months and the forecast for August, meteorological drought/dry spells are likely to be experienced by the end of the month in some areas of Bicol Region, Eastern Visayas, and Negros Island Region.

Meanwhile, near-average to warmer-than-average mean temperatures are expected over most parts of the country, aside from slightly cooler-than-average conditions over Occidental Mindoro and Bohol. The ranges of forecast temperature are as follows: 13.6°C – 27.2°C in the mountainous areas of Luzon, 21.8°C – 36.8°C for Metro Manila, 20.2°C – 38.8°C over the rest of Luzon, 21.1°C – 37.1°C in Visayas, 13.4°C – 33.9°C in the mountainous areas of Mindanao, and 20.0°C – 37.9°C over the rest of Mindanao.

DOST-PAGASA will continue to closely monitor the ongoing El Niño and its associated impacts on the country's climate. Meanwhile, all government agencies and the general public are strongly advised to take appropriate preparedness and response measures to mitigate their potential impacts, particularly in areas vulnerable to heavy rainfall and floods during Habagat season and those areas prone to below-normal rainfall conditions.

For more information, please call the Climatology and Agrometeorology Division (CAD) at (02)8284-0800, local 4920 or 4921.
