FOREWORD

For decades, hunger remains a long-standing problem in most countries including the Philippines. When the body gets deprived of food for long periods, it can lead to malnutrition which affects the individual's function and subsequently affects the family and the entire nation.

The Millennium Development Goals was drafted by the United Nations to address hunger issue. Through the years, improvements were seen in the hunger status of families worldwide. Although the Philippines saw a gradual reduction in the number of hunger-stricken households, many Filipino families still suffer from hunger by the end of the goal deadline in 2015.

As the premiere research agency on food and nutrition in the Philippines, the Food and Nutrition Research Institute is mandated to conduct studies that define the citizenry's nutritional status, determine the causes and effects of nutritional problems, and recommend appropriate solutions to address the issue of malnutrition. The National Nutrition Survey (NNS) is conducted every five years followed by the Updating Survey, conducted every three years in between NNS to obtain data on the current nutritional status of the Filipino people and to keep track on the latest trends in the nutritional situation of Filipinos. This monograph presents the results of the 2015 Updating Survey which highlights the changes on the food security status of the Filipino people since the 8th NNS conducted last 2013.

We hope that this monograph would provide valuable input to help program and policy makers, both in the private and public sector, formulate effective interventions by identifying vulnerable populations and understanding the factors that contribute to their vulnerability. We further hope that our readers would become more aware of the current food security situation in the country, and how this ultimately affects the nutritional situation of every Filipino. Food security and hunger are closely related; addressing food security problem would lead to solving hunger issue.

We are calling everyone to join us in our fight against hunger and malnutrition.

ACKNOWLEDGMENTS

Grateful acknowledgement and appreciation are due to the following:

The Department of Health (DOH), Health Policy Development and Planning Bureau, and the DOST-Philippine Council for Health Research and Development (DOST-PCHRD), through the 2015 Health Systems Research Management, for funding the project titled "Evaluation of the Attainment of Health-Related Millennium Development Goals (MDGs)" integrated in the 2015 Updating Survey;

The Philippine Society of Hypertension (PSH) and the Cardiology Unit and Pediatrics Unit of the Philippine General Hospital (PGH) for sharing their expertise during the Blood Pressure Certification Training;

The Philippine Statistics Authority (formerly National Statistics Office) for the technical assistance in providing the list of sample housing units and sample households;

The Department of Interior and Local Government (DILG), Local Government Units (LGUs), the Governors, Mayors, Barangay Captains, and their constituents for providing direct assistance in the field survey operations;

The National Nutrition Council of the Department of Health (NNC-DOH), through its Regional Nutrition Program Coordinators (RNPCs) and Provincial/City and Municipal Nutrition Action Officers (PNAOs/CNAOs and MNAOs), for sharing their untiring guidance and incessant support during field data collection;

The Department of Science and Technology Regional Directors (RDs) and Provincial Science and Technology Directors (PSTDs) for their support, especially during field data collection, training, and pre-survey coordination in the regions/provinces;

The Centers for Health Development (CHDs) - Department of Health (DOH) through its Regional Directors and the Provincial/City and Municipal Health Officers (PHOs/CHOs and MHOs) for their assistance during field data collection;

Dr. Arturo Y. Pacificador, Jr., in his capacity as statistical consultant, for the technical guidance in sampling design;

The FNRI Finance and Administrative Division (FAD) for their invaluable assistance in the financial aspect of the survey;

All 42,310 households and 161,577 individuals for their indispensable participation and utmost cooperation in the survey; and

All FNRI technical and non-technical staff, local researchers, local survey aides, and numerous others who have provided their inputs, involvement, and contribution to the fruition of the Updating of Nutritional Status of Filipino Children and Other Population Groups: Philippines, 2015.

OPERATIONAL DEFINITION

Barangay in the Philippines: a village, suburb, or other demarcated neighborhood; a small territorial and administrative district forming the most local level of government (Oxford University, 2010).

Condiment refers to a food that is generally eaten in a very small quantity, often just for flavor. An example would be a 'pinch' of fish powder, a teaspoon of milk tea, spices, etc. (World Food Programme [WFP], 2008).

Dietary Diversity Score is defined as the number of different foods or food groups eaten for the previous seven (7) days (past week), not regarding the frequency of consumption (WFP, 2008).

Enumeration Area (EA) is a delineated geographic area usually consisting of about 150 to 200 households. It could be an entire barangay or part of a barangay (PSA, 2015)

Food Consumption Score is a composite score calculated using the frequency of consumption and nutritional importance of different food groups consumed by a household during the seven (7) days before the survey (WFP, 2008).

Food Frequency is defined as the number of days food was consumed at the household level over a reference period (e.g. number of days of consumption in the past 7 days)

Food Group is defined as a grouping of food items that have similar nutritional properties or biological characteristics (WFP, 2008).

Food Accessibility refers to access by individuals to adequate resources for acquiring appropriate foods for a nutritious diet. It encompasses their income, expenditure, and buying capacity (Philippine Food Security Information System [PhilFSIS], 2014a).

Food Insecurity is the limited or uncertain availability of nutritionally adequate and safe foods or limited or uncertain ability to acquire acceptable foods in socially acceptable ways (Life Sciences Research Office, 1990).

Food Item cannot be split into separate foods. However, generic terms such as 'fish' or 'poultry' are generally considered to be food items for the purpose of this analysis (WFP, 2008).

Food Security is the access by all people at all times to enough food for an active, healthy life. Food security includes at a minimum: (1) the ready availability of nutritionally-adequate and safe foods and (2) an assured ability to acquire acceptable foods in socially acceptable ways (e.g., without resorting to emergency food supplies, scavenging, stealing, or other coping strategies (World Food Summit, 1996).

Food Utilization is the ability of the human body to ingest and metabolize food through adequate diet, clean water, good sanitation and health care to reach a state of nutritional well-being where all physiological needs are met (PhilFSIS, 2014b).

Household is a group of persons who may be related or not, who sleep in the same dwelling unit and have common arrangements for the preparation and consumption of food. A person who lives alone is also considered as a separate household.

Household Food Access is the ability to acquire sufficient quality and quantity of food to meet all household members' nutritional requirement for productive lives (Swindale, 2006).

Household Head refers to an adult person, male or female, who is regarded as the head of the members of the household; responsible for the organization and care of the household.

Hunger is the uneasy or painful sensation caused by a lack of food.

Lack of resources means not having money or the ability to grow or trade for food (Coates, Swindale & Bilinsky, 2007).

Millennium Development Goals are the world's time-bound and quantified targets for addressing extreme poverty in its many dimensions – income poverty, hunger, disease, lack of adequate shelter, and exclusion – while promoting gender equality, education, and environmental sustainability. These goals are set to be achieved by 2015 (Millennium Project, 2006).

Respondent is the person in the sample household who is responsible for food preparation of the household the previous day.

Sustainable Development Goals, also known as "Global Goals", is a set of 17 goals built upon the success of the Millennium Development Goals, with addition of new areas such as climate change, economic inequality, innovation, sustainable consumption, peace and justice, among others. It came into effect on January 2016, and is aimed to be fulfilled by the year 2030 (United Nations Development Programme, 2016).

17	Proportion of households with poor food consumption score with standard error, confidence interval, and coefficient of variation by region and province: Philippines, 2015	87
18	Proportion of households with borderline food consumption score with standard error, confidence interval, and coefficient of variation by region and province: Philippines, 2015	89
19	Proportion of households with acceptable food consumption score with standard error, confidence interval, and coefficient of variation by region and province: Philippines, 2015	91
20	Percent distribution of households by food security status and socio-demographic characteristics: Philippines, 2015	93
21	Household food security questionnaire	94
22	Household dietary diversity and food frequency questionnaire	96

SUMMARY OF FINDINGS

As of 2015, one out of three or 33.9% of Filipino households were food secure. More than half (60.8%) of Filipino households never or rarely worried about obtaining enough food, however, 13.7% frequently experienced the opposite. About 11.4% of households often were unable to eat foods they prefer, while 8.0% of households often eat food they do not really want. There were 33.9% of households who limit the variety of food consumed on some occasions. To stretch limited food supply, some households have members who reduced the size of meals eaten (27.2%), or ate fewer meals (15.5%). In severe cases, some households experienced not having any food at home (6.8%), had a member who went to sleep hungry (5.5%), or went through a day without eating anything (2.8%).

The regions with the largest proportion of food secure households were CALABARZON (44.4%) and Central Luzon (43.3%). On the other hand, ARMM had the highest rate of severely food insecure households (44.5%) and the lowest number of food secure households (15.0%).

Households with less than five members (37.8%), resides in an urbanized location (40.1%), and has a female household head (38.5%) were more food secure than their counterparts. Also, households headed by professionals (67.4%) and college graduates (67.7%) were more food secure than households headed by those working in the fisheries and agriculture sector (21.8%) and had low or did not have any educational attainment (15.9%).

Households whose wealth category were in the highest tiers were found to be more food secure compared to households in the poorest wealth category. Rich households comprised 42.6% of the food secure population, while those in the richest category comprised 71.6% of the food secure households in the country. Wealthy households tend to have the most diverse diets as well. Mean dietary diversity scores for the middle-income (9.4 points), rich (9.7 points), and the richest (10.2 points) households were among the country's highest.

The food groups that were consumed by most households in the Philippines include cereals and cereal products (99.8%); meat and fish (98.8%); vegetables (97.9%); spices, beverages, and condiments (95.8%); and oils (90.4%). Majority of households acquired their consumed food groups such as spices, condiments, and beverages (98.5%); oils and sweets (both 98.4%); milk (98.1%) eggs (93.7%); and fish (92.2%) by purchasing. Some households who consume food groups such as dark green leafy vegetables (46.0%), vitamin A-rich fruits (31.6%), and other vegetables (21.0%) obtained their supply mostly through own production. Though a vast majority of the Filipino population still rely on purchases, self-produced rice were consumed the most in Cagayan Valley (25.3%) and CAR (24.1%).

INTRODUCTION

Food security ensures that the basic human need for sustenance is met by enabling everyone to have a stable access to various foods that are of good quality, safe, affordable, and in sufficient quantities; and that it is utilized well. Freedom from hunger is a fundamental human right; however, 805 million people worldwide still go hungry each day (FAO, IFAD and WFP, 2014).

The global community made a commitment to lessen the number of hungry people through the Millennium Development Goals (MDG). Since its launch in the year 2000, the world has seen more and more populations whose living conditions had improved through the years that followed.

The year 2015 is the target period set to achieve these goals. According to the United Nation's Millennium Development Goals Report 2015, the proportion of undernourished people in the developing regions has fallen by almost half since 1990. However, despite the best efforts poured in by numerous government and non-government agencies, the Philippines failed to meet the MDG 1, which was to eradicate extreme poverty and hunger.

In succession to the MDG, the United Nations drafted a new set of targets called the Sustainable Development Goals (SDG). Not only do these goals cover what the MDG is yet to achieve; they also aim to make sure that the world sustains enough resources and remain habitable for future generations. Major targets of SDG were to end hunger, promote food security and sustainable agriculture, among others.

For years, the Food and Nutrition Research Institute has committed itself to a mission of providing accurate, reliable, and timely information in food, health, and nutrition for every Filipino citizen through the development of the National Nutrition Survey (NNS) every five years, and the Updating Survey of the Nutritional Status of Filipino Children every 2-3 years in between. This monograph presents the results of the Food Security component of the 2015 Updating Survey of the Nutritional Status of Filipino Children and Other Population Groups. Data on household food security status using experienced-based scale will be used to complement dietary data to assess progress on dietary adequacy under MDG 1. Likewise, this can serve as baseline information for the MDG successor which is the SDG.

From 2001-2011, FNRI used the Radimer-Cornell tool to assess food insecurity, and was replaced by the Household Food Insecurity Access Scale (HFIAS) in the succeeding surveys. To assess the dietary diversity of Filipino households, the Household Dietary Diversity (HDD) and food frequency questionnaire through the use of Food Consumption Score (FCS) were utilized upon the recommendation and support of the World Food Programme (WFP).

The Household Food Insecurity Access Scale (HFIAS) was first used in the United States to estimate the prevalence of food security, and was later found out to be a feasible and useful approach in developing countries as well. The nine generic questions identified by the Food and Nutrition Technical Assistance (FANTA) and its partners from the U.S. Household Food Security Survey Module (US HFSSM) generally represent the domains of household food insecurity and can be used to categorize the household based on the severity of food insecurity, and provides information on the prevalence and magnitude of food insecurity at the household level (Coates, et al., 2007).

The Household Dietary Diversity (HDD) and food frequency questionnaire aim to estimate whether the household is able to access items from the basic food groups in their habitual diet (FNRI, 2015). They also provide information on the household's economic access to food, and at the same time, describe the food access of households in terms of type or variety, frequency, and mechanism on how food was accessed (FNRI, 2013).The Food Consumption Score represents the dietary diversity and nutrient value of the food that the household eats, and is based on the number of food groups the household consumed over a period of time, the number of times a specific food group is consumed, and its relative nutritional importance (WFP, 2009).

METHODOLOGY

Sampling Design

The 2015 Updating of Nutritional Status of Filipino Children and Other Population Groups covered 17 Regions and 80 provinces including NCR. The province of Batanes was excluded for logistic reasons. Data collection was conducted from July 20, 2015 to November 30, 2015.

The survey adopted the Philippine Statistics Authority (formerly the National Statistics Office, NSO) Master Sample (MS) which utilized the 2015 Labor Force Survey (LFS) Households.

The statistical design employed a stratified three-stage sampling. The first stage of the sampling was the selection of the Primary Sampling Unit (PSU) which consisted of one barangay or contiguous barangays with at least 500 households each. From these PSUs, enumeration areas (EAs) with 150-200 households were identified from which housing units were randomly selected. The third and final stage was the random selection of the households, which became the ultimate sampling unit (Barcenas, 2004). Overall, about 42,310 sample households were covered in the survey.

The detailed sampling design and coverage is presented in the Overview of the 2015 Updating of Nutritional Status of Filipino Children and Other Population Groups.

Scope and Coverage

For this component, all of the four replicates of the Master Sample were covered with a total of 48,178 eligible households, out of which, 41,282 households were respondents for food security. Households who purchased and consumed food outside the home, which totaled to 389, were excluded from the Household Dietary Diversity (HDD) and Food Frequency questionnaires. Hence, only 40,893 households participated in the HDD and Food Frequency questionnaires. Overall, the Food Security Survey had 85.7% response rate as shown in Table 1. Northern Mindanao had the highest response rate (96.3%) while ARMM had the lowest (65.6%).

Table 1. Food Security: Eligibility and response rate of households

Region	Eligible (No. of households)	Response (No. of respondent households)	% Response
Philippines	**48,178**	**41,282**	**85.7**
NCR	4,628	3,307	71.5
CAR	2,032	1,704	83.9
Ilocos Region	2,649	2,367	89.4
Cagayan Valley	2,473	2,308	93.3

Survey Methods

Two sets of pre-tested questionnaires were used in assessing food security status of households: (1) Household Food Insecurity Access Scale (HFIAS), and (2) Household Dietary Diversity and Food Frequency Questionnaire (See attached questionnaire in Appendix 21 and 22). Both questionnaires were available in Tagalog, English, and other local dialects such as Cebuano, Ilocano, and Bisaya. The questionnaires were administered by professionally-trained field researchers (nutritionist-dietitians, nurses) through face-to-face interviews using the Data Collection System (DCS) software installed in computer netbooks (e-DCS).

The respondent was identified as the person responsible mainly for food preparation of the household. If that person was not available at the moment of interview, another adult member who was present and also plays a role in food preparation of the household was selected to substitute for the main respondent. Collected data were checked for completeness and correctness by the team leader before data was transmitted to FNRI.

In the Household Food Insecurity Access Scale (HFIAS) questionnaire, nine occurrence questions were asked based from the household's food consumption during the previous month, followed by questions on how often the conditions were experienced by the household.

In the Household Dietary Diversity (HDD) and Food Frequency Questionnaire, the frequency of consumption of 16 food groups and the most commonly consumed food item per food group were asked based on a 7-day recall period. Foods included were those prepared and consumed at home; or prepared at home and consumed outside; or purchased or gathered outside and consumed at home. However, foods both purchased and consumed outside the home were excluded. Respondents were also asked about the primary source or means of procuring foods categorized as follows: a) purchased/bought; b) own produce; c) hunted, fished or gathered; d) borrowed (when there is an intention to pay back the food in cash or in kind); e) exchanged for labor (Food for Work); f) bartered (in exchange for another food item); g) received as gift or as food aid; or h) given for free.

Probing questions were asked for special foods given to children or lactating/pregnant women and for added foods such as sugar in tea, or oil in mixed dishes or fried foods. If a mixed dish was eaten, all the ingredients of the dish eaten were asked and recorded.

Ethical Review

The project entitled "2015 Updating of Nutritional Status of Filipino Children and Other Population Groups" was granted approval by the FNRI Institutional Ethics and Review Committee (FNRI-IERC) last July 20, 2015.

Written consent to participate in the 2015 Survey was obtained from the respondents and subjects (through the mother or guardian for children six years old and below prior to the interview and other measurements). An assent form was also given for children ages six to 12 years old. The Informed Consent and Assent Form explained the background and objectives of the survey, the data collection procedures, involved risks (any undesirable effect that may result or invasion circumstances, e.g., expected duration of the interview with respondent) and benefits of participation, confidentiality of information, option to withdraw without penalty or consequences, and the respondent's written consent.

PSA Review and Approval

The Philippine Statistics Authority granted clearance for the 2015 Updating Survey – Food Security Questionnaires last July 15, 2015 (See 2015 Updating Survey Overview Monograph).

Data Processing and Analysis

Data were cleaned and validated upon reception. Analysis was done using STATA version 13. Different scoring and categories were used to gauge the level of food insecurity of the Filipino households.

The Household Food Insecurity Access Scale (HFIAS) provides information on the prevalence and magnitude of food insecurity at the household level. The standard procedure for scoring is shown in Table 2; the total HFIAS score for each household could range from 0 (food security) to 27 (maximum food insecurity). The higher the score, the more food insecure the household becomes (Coates et al., 2007).

Table 2. Household Food Insecurity Access Scale Score: Philippines, 2015

Frequency of Occurrence	Scoring (pts.)
Never occurred (0 times)	0
Rarely (1-2 times)	1
Sometimes (3-10 times)	2
Often (>10 times)	3

*Reference period used was past 30 days.

The Household Food Insecurity Access Scale is categorized into four levels: food secure, mildly, moderately, and severely food insecure. The households increase their level of food insecurity when they experience adverse conditions more severely or more frequently.

As illustrated in Table 3, a food secure household does not experience any of the conditions or just rarely worries about food. A household becomes mildly food insecure if it sometimes or often worries about food, and/or is unable to eat preferred foods, and/or rarely experiences having to eat less varied foods, and/or eat foods they really do not want to eat. A moderately food insecure household sacrifices food quality, as it sometimes or often eats a less varied diet and/or undesirable foods, and starts to cut back on the quantity of foods by reducing the meal portion or the number of meals, rarely or sometimes, but it does not experience the three most severe conditions. A severely food insecure household often cuts back the quantity of foods and experiences the three most severe conditions (running out of food, going to sleep hungry and not eating for the whole day). Any household which experiences any of the three severe conditions is already considered severely food insecure (Coates et al., 2007).

Table 3. Categories of food insecurity[1]

Situation(s) experienced in the past month	Frequency		
	Rarely 1-2x	Sometimes 3-10x	Often >10x
1. Worry about food	Food Secure	Mild	Mild
2. Unable to eat preferred foods	Mild	Mild	Mild
3. Eat just a few kinds of foods	Mild	Moderate	Moderate
4. Eat foods they really do not want to eat	Mild	Moderate	Moderate
5. Eat a smaller meal	Moderate	Moderate	Severe
6. Eat fewer meals in a day	Moderate	Moderate	Severe
7. No food of any kind in the household	Severe	Severe	Severe
8. Go to sleep hungry	Severe	Severe	Severe
9. Go a whole day and night without eating	Severe	Severe	Severe

Legend:	Food Secure	Mild	Moderate	Severe

[1] Household Food Insecurity Access Scale Indicator Guide, v.3

The Diet Diversity questionnaire provides a better understanding of the access of households to various food items as well as the quality of food access in terms of diversity and food frequency using the Food Consumption Score (FCS) which was developed by World Food Programme (WFP).

Sixteen (16) food groups were used to measure the diversity of food consumed by the household as shown in the illustration below[2]:

[2] Sources of images:
- FNRI-DOST
- Google Images

As cited by Nueva España, et al. (2014), "the higher the diet diversity score, the more varied the diet and the higher the possibility that different nutrients will be met because no single food could provide all nutrients needed by the body", as "each particular food group contains nutrients that complement the nutrients contained in other foods".

The FCS is a frequency-weighted diet diversity score calculated using the frequency of consumption of different food groups consumed by a household during the seven days before the survey. The FCS were calculated based on the diversity of household's consumption of nine food groups – main staples, vegetables, fruits, meat and fish, oils, condiments, sugar, milk and pulses. These were weighted according to the quality of nutrients that it brings to the diet, multiplied by the frequency (number of days) of consumption. This weighing gives more importance to foods such as meat and fish because they have the highest quality protein, and easily absorbable micronutrients; while it gives lesser importance to food such as sugar because it only contains calories and is usually consumed in small quantities.

To compute for the FCS, the frequency of consumption is multiplied by the weight assigned to each specific food group as shown in Table 4. For example, for the past seven (7) days, the household consumed rice and oil on a daily basis (7 days), consumed meat for three (3) days, and consumed vegetables for two (2) days. These frequencies are multiplied by the corresponding weight of the food group, and then these scores are summed into one composite score (Table 5.) FCS scores are divided into three categories: 0-28 points indicate poor food consumption, more than 28-42 points indicate borderline food consumption, and more than 42 points indicate acceptable food consumption. A score beyond 42 implies that all food groups were consumed every day for the past seven days. The composite score was then compared to the pre-established threshold that indicates the household's food consumption status (Table 6).

Table 4. FCS standard food group and current standard weights by the WFP

	Food Items (examples)	Food Groups (Definitive)	Weight (Definitive)
1	Rice, bread, noodles, biscuits, cookies or any rice and cereal products *like biko, suman (malagkit), puto, noodles/pasta, porridge (arrozcaldo/champorado) and others*	Main Staples	2
	Cassava, potatoes and sweet potatoes, other tubers and plantains		
2	Beans, peas, lentils, nuts, seeds or foods made from these like pork and beans, guisantes de lata and others	Pulses	3
3	Vegetables, leaves	Vegetables	1
4	Fruits	Fruit	1
5	Beef, goat, poultry, eggs, fish, and shellfish	Meat and Fish	4
6	Milk, yogurt and other dairy	Milk	4
7	Sugar and sugar products, honey	Sugar	0.5
8	Oils, fats, and butter	Oil	0.5
9	Spices, tea, coffee, salt, fish powder, small amounts of milk for tea	Condiments	0

Table 5. An example of a completed food consumption score template

	Food Items (examples)	Food Groups (Definitive)	Weight (A)	Number of days eaten in the past 7 days (B)	Score A x B
1	Rice, bread, noodles, biscuits, cookies or any rice and cereal products *like biko, suman (malagkit), puto, noodles/pasta, porridge (arrozcaldo/champorado) and others*	Main Staples	2	7	14
	Cassava, potatoes and sweet potatoes, other tubers and plantains				
2	Beans, peas, lentils, nuts, seeds or foods made from these like pork and beans, guisantes de lata and others	Pulses	3	0	0
3	Vegetables, leaves	Vegetables	1	2	2
4	Fruits	Fruit	1	0	0
5	Beef, goat, poultry, eggs, fish, and shellfish	Meat and Fish	4	3	12
6	Milk, yogurt and other dairy	Milk	4	0	0
7	Sugar and sugar products, honey	Sugar	0.5	0	0
8	Oils, fats, and butter	Oil	0.5	7	3.5
9	Spices, tea, coffee, salt, fish powder, small amounts of milk for tea	Condiments	0	0	0
			Composite Score		**26**

Households with scores below 28 are considered to have poor food consumption. Those with scores between 28 and 42 have borderline food consumption, while scores above 42 were considered to have acceptable food consumption (Table 6).

Table 6. World Food Programme Food Consumption Scores

Score	Food Consumption Groups
0-28	Poor Food Consumption
>28 to 42	Borderline Food Consumption
>42	Acceptable Food Consumption

RESULTS

Household Food Security using HFIAS

Food security exists when all people at all times have physical and economic access to sufficient, safe, and nutritious food that meets their dietary needs and food preferences for an active and healthy life (World Food Summit, 1996). This definition embodies the four pillars of food security: (1) physical availability of food; (2) economic and physical access to food; (3) food utilization; and, (4) stability of these three dimensions over time (FAO, 2008).

Nationwide, there were 33.9% households that were food secure, with CALABARZON (44.4%) and Central Luzon (43.3%) being the two regions with the largest proportions (Figure 2). On the other hand, 21.9% of households in the Philippines were severely food insecure, with ARMM as the region having the highest proportion of severely food insecure households at 44.5% (Table 7). The rates of moderately food insecure households in most regions were almost equal to the proportions of food secure households, and the number of severely food insecure homes surpasses the number of mildly food insecure households by 9.6% (Figure 1).

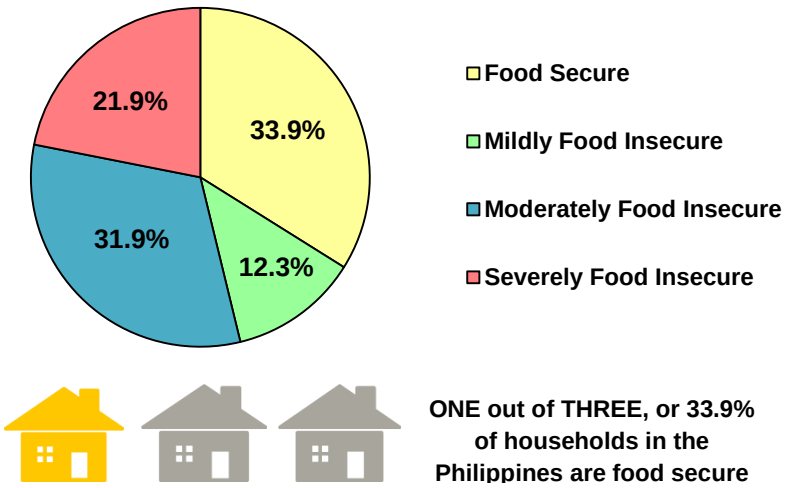

Figure 1. Percent distribution of households by food security status: Philippines, 2015

Among the seventeen regions in the Philippines, CALABARZON had the largest proportion of food secure households (44.4%), followed by Central Luzon (43.3%), CAR (39.3%), and NCR (36.1%) (Figure 2). ARMM, on the other hand, had the country's smallest population of food secure households at only 15.0%. Armed conflict is one of the major challenges faced in the development of this region, coupled with heavy flooding during rainy seasons. These incidences leave several families displaced with unfavorable living conditions (World Food Programme, 2016). Fairly high rates of moderate food insecurity were seen in Caraga (41.4%), Western Visayas (40.3%), Bicol (38.3%), Zamboanga Peninsula (37.9%), Eastern Visayas (37.8%), and SOCCSKSARGEN (37.5%) (Table 7).

Table 7. Percent distribution of households by food security status and region: Philippines, 2015

Caraga	1,927	27.7	10.3	41.4	20.6

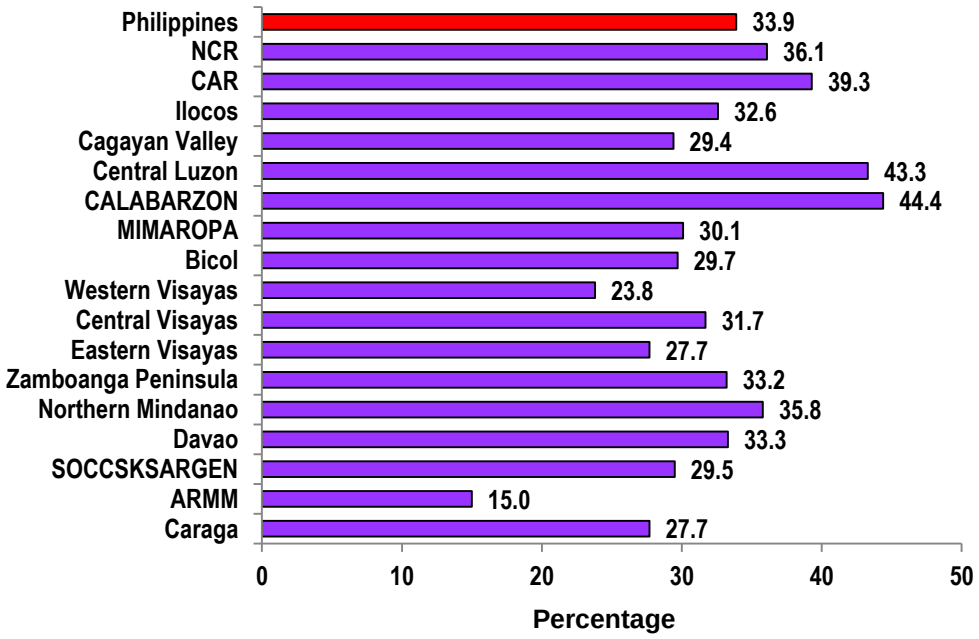

Figure 2. Proportion of food secure households by region: Philippines, 2015

On a 95% confidence interval, the regions of CALABARZON, Central Luzon, and Cordillera Administrative Region had significantly higher proportion of food secure households than the national estimate of 33.9%. Conversely, ARMM, Western Visayas, Eastern Visayas, and CARAGA had the lowest significant proportions of food secure households compared to the national estimate (Figure 3). Among provinces, Bataan had a significantly higher proportion of food secure households, while Lanao del Sur had the significantly lowest estimate (Figure 4).

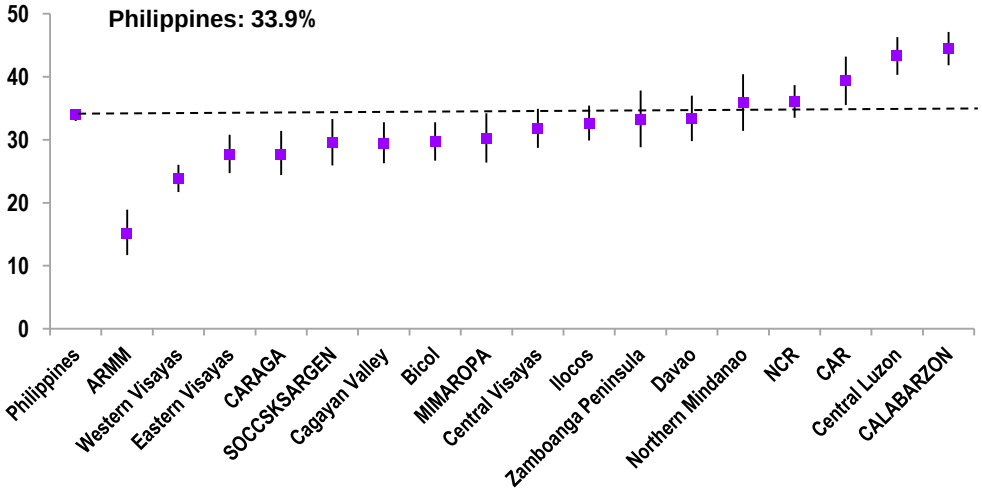

Figure 3. Proportion of food secure households and the 95% confidence interval by region: Philippines, 2015

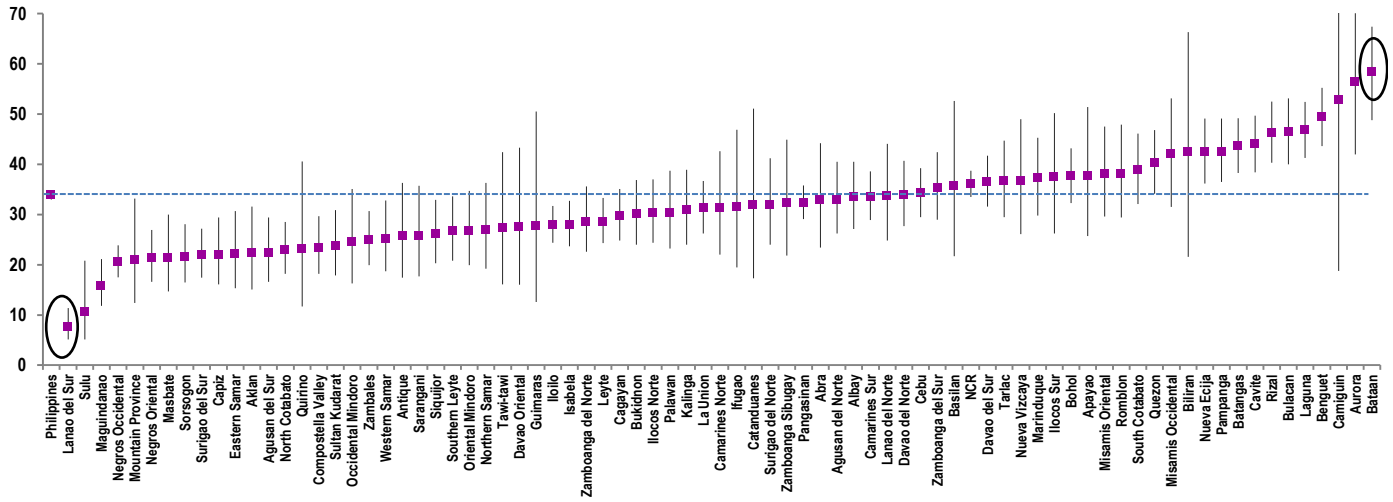

Figure 4. Proportion of food secure households and the 95% confidence interval by province: Philippines, 2015

The socio-demographic characteristics of a household contribute to its food security. It has been found that households with more than five (5) members were more likely to be severely food insecure (26.3%) compared to households with fewer than five members (19.7%) (Table 8). A larger proportion of food secure households were found among those residing in urban areas (40.1%), and among the rich (42.6%) and richest (71.6%) wealth quintiles (Table 8 and Figure 5). The proportion of food secure households headed by a female is 5.9% greater than those headed by a male (Table 8).

The occupation of the household head can also be an indicator to the household's food security status; a better job means more income, thus more budget allowance for food. Households headed by professionals such as doctors, lawyers, etc. were the most food secure (67.4%), followed by members of the armed forces (62.9%), and managers such as farm managers, project managers, administrative services managers, corporate managers, etc. (59.6%). Households headed by clerical support workers (51.1%), and technicians and associate professionals (50.9%) were also fairly food secure. On the other hand, households with heads whose occupations involved elementary jobs (19.8%) and those involved in agricultural, forestry, and fisheries (21.8%) were the least food secure. Meanwhile, the number food secure household heads that has no occupation which also includes pensioners was 20.7% greater than those with elementary jobs (Table 8 and Figure 5).

A rising trend in the rates of food secure households can be observed as the educational attainment of the household head increases. Household heads who graduated college were mostly food secure (67.7%), compared to those without any educational attainment (15.9%) (Table 8 and Figure 5).

Table 8: Percent distribution of households by food security status and socio-demographic characteristics: Philippines, 2015 (n=41,282)

Proportion of food secure households by socio-demographic characteristics: Philippines, 2015

Figure 6 shows the percentage of households who experienced food insecurity based on nine occurrence questions of the HFIAS. Around 60.8% of Filipinos never or rarely worried about obtaining the next meal to eat, while 13.7% often experienced the opposite. The proportion of households who were unable to eat preferred food on occasion was 25.4%, while 33.9% sometimes or often limited the variety of food consumed, usually to what was only available on hand.

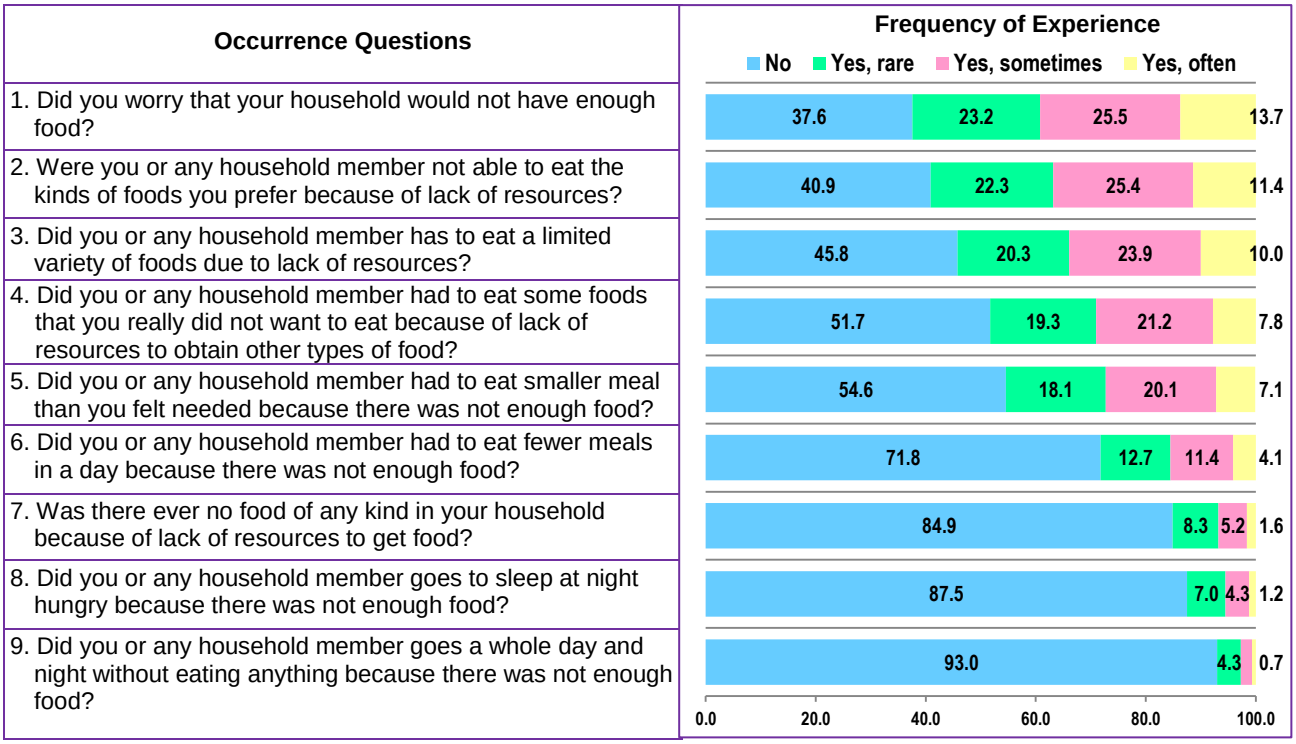

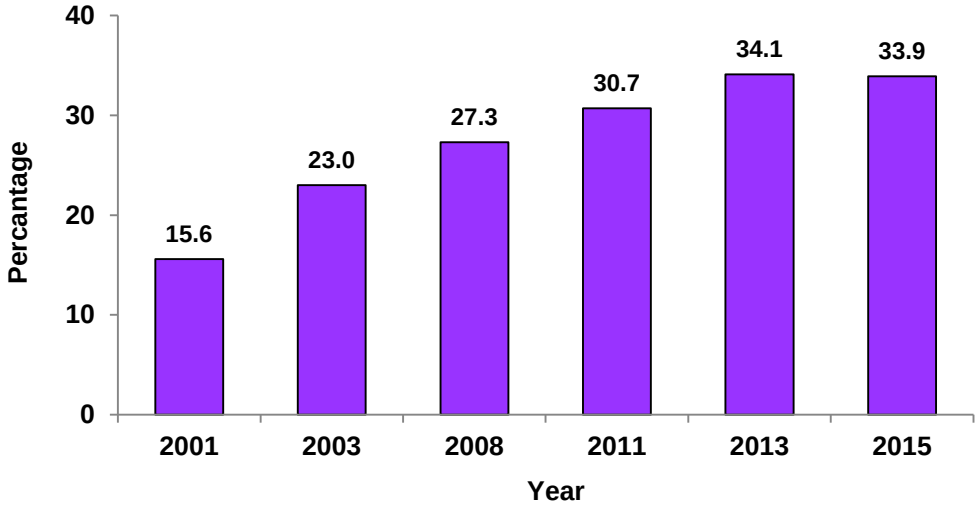

Figure 6. Percent distribution of households by frequency of experience based on HFIAS questionnaire: Philippines, 2015

Optimum food security does not only include having a steady access to a wide assortment of foods. Aside from variety, foods must be desirable as well. During the survey, there were 7.8% of households who often eat unwanted food, mostly due to lack of income or other means to obtain better type or quality of food (Figure 6).

More than one-fourth or 27.2% of households reduced the amount of food taken in a meal occasionally or often, for reasons such as insufficient food supply, inadequate means to acquire ample amounts of food, or just so other family members could obtain a fair share of the day's meal. Meanwhile, 15.5% of households sometimes or often ate fewer than the typical number of meals in a day for the very same reasons (Figure 6).

A segment of the population (1.6%) frequently experienced having empty food stocks at home. There were households who had at least one member who sometimes (4.3%) or often (1.2%) went to bed on an empty stomach. While the vast majority (93.0%) of households did not go about the whole day without eating any food, the remaining 7.0% had experienced this situation at least once (Figure 6).

The attainment of food security for all Filipinos made a slow progress. A steady, gradual increase in the proportion of food secure households was observed from 2001 (15.6%) to 2013 (34.1%). A minor decline of 0.2%, although not statistically significant, was observed in 2015 at 33.9% (Figure 7). The decline may be attributed, among other factors, to the series of natural calamities such as strong typhoons that devastated the Philippines few years prior, leaving negative impact on the social and economic conditions of the people in affected areas. Note that a different assessment tool and reference period was used in previous surveys.

Reference period for food security:
2001-2003: past 6 months, Radimer/Cornell Tool
2008-2011: past 3 months, Radimer/Cornell Tool
2013 and 2015: past month (30 days), HFIAS

Figure 7. Proportion of food secure households: Philippines, 2001-2015

Household Dietary Diversity

Dietary diversity represents the number of food groups consumed by a household over a given period, and for this survey, it refers to the previous week or previous seven (7) days prior to the interview. A score or point is given for every food group consumed by the household. This score is a proxy measure of household's food access and the quality of their diet.

Also included were information on how consumed food groups were accessed, the frequency of consumption, and mechanisms on how these food groups were obtained.

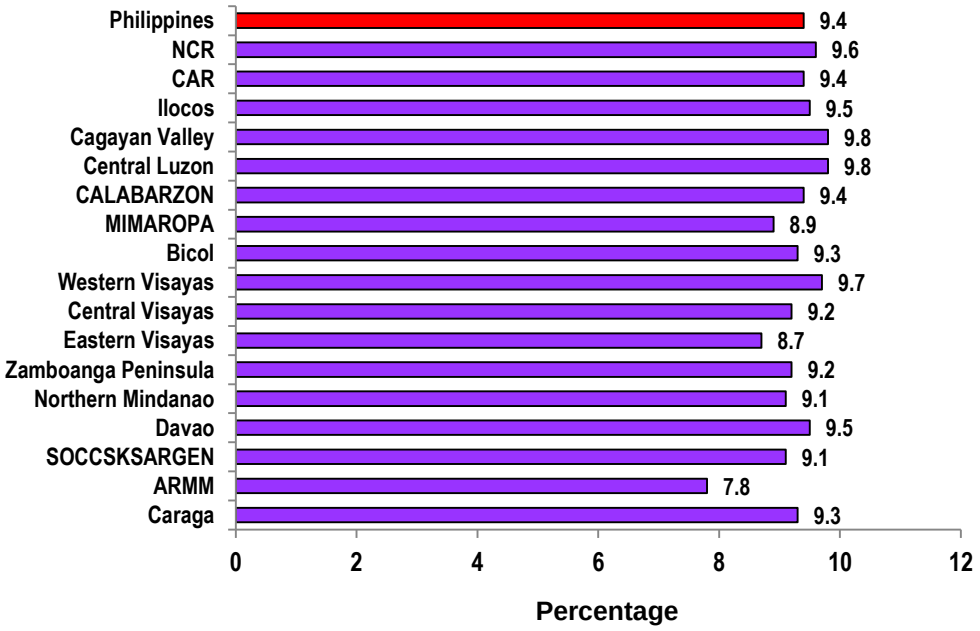

Figure 8. Mean dietary diversity score by region: Philippines, 2015

Filipinos generally consume around nine different food groups per week (Table 9 and Figure 8). Among the regions, households in Cagayan Valley and Central Luzon has the most varied diet, both having the highest mean dietary diversity score of 9.8 points. On the other hand, ARMM scored the lowest at only 7.8 points, which implies that households in this region likely consume monotonous diets. This was followed by Eastern Visayas (8.7) and MIMAROPA (8.9) (Table 9).

Table 9. Mean dietary diversity score by region: Philippines, 2015

ARMM	1,727	7.8	14.4	7.5	8.1	1.8
Caraga	1,921	9.3	10.1	9.1	9.5	1.1

The results for the weekly food recall reveals that the most commonly consumed food groups were cereals, cereal products, and grains (99.7%) such as rice, bread, biscuits, noodles, corn, and other similar products (Figure 9). Majority of households also consumed vegetables (97.9%), followed by beverages, spices, and condiments group (95.8%), fish and other seafood (90.8%), and oils and fats (90.4%).

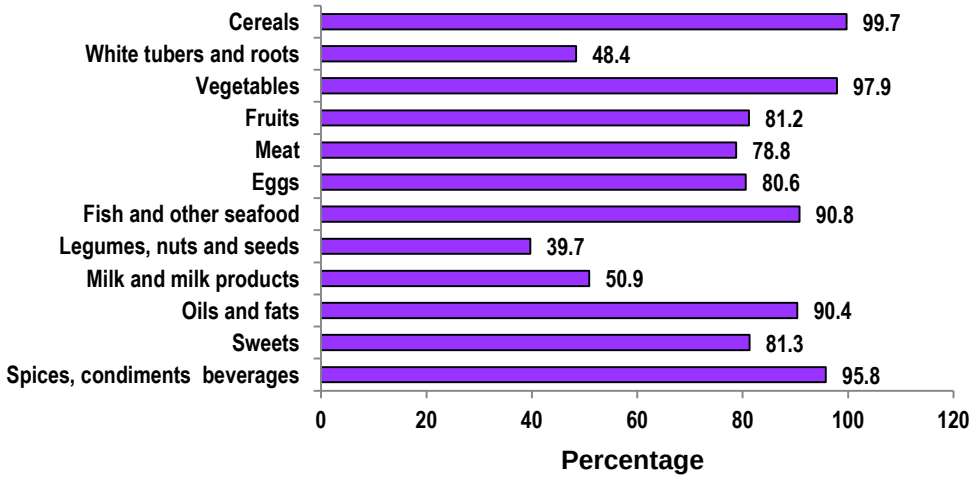

Figure 9. Proportion of households consuming the 12 food groups of the HDDS: Philippines, 2015

Based on the national estimates (Table 10), cereals were the most common food group consumed by almost all households (99.7%), followed by vegetables, which were consumed by 97.9%, and spices, condiments, and beverages as consumed by 95.8% of households. The least consumed food groups were legumes, nuts and seeds (39.7%) with Eastern Visayas having the lowest proportion (24.7%) of consumers. On the other hand, white tubers and roots, and dairy products, were consumed by about 5 in every 10 households. Among all regions, ARMM has the lowest proportion of households consuming almost all of the food groups.

To measure the dietary diversity of households, 12 food groups were ranked based on frequency of consumption, and were divided into three categories (Table 11). Staples, vegetables, fish, beverages, and spices are often found in every meal, and are classified as the initial group. As a household's diet varies, more food groups are included, such as oils, sweets, fruits, and eggs (yellow highlight). Households who consumed around 6-8 food groups in a week are considered to have borderline food consumption. A diet including all previously mentioned food groups, with addition of meat, milk, tubers, and legumes is considered well-diverse, and is therefore categorized to have "acceptable" food consumption.

Table 11. Summary of food groups consumed by rank according to the frequency of consumption: Philippines, 2015

Dietary Diversity Score Food Groups		
Consuming 1- 4 Groups	**Consuming 5-8 Groups**	**Consuming 9-12 Groups**
Staples	Staples	Staples
Vegetables	Vegetables	Vegetables
Fish	Fish	Fish
Beverages, Condiments, Spices	Beverages, Condiments, Spices	Beverages, Condiments, Spices
	Oils	Oils
	Sweets	Sweets
	Fruits	Fruits
	Egg	Egg
		Meat
		Milk
		Tubers
		Legumes

Table 12 shows the percentage distribution of households per region according to the three Dietary Diversity Score (DDS) categories. Nationwide, seven (7) out of ten (10) households consumed nine (9) to twelve (12) different types of food groups per week. Among regions (Figure 10), Cagayan Valley (80.0%) had the largest proportion of households who consumed the most diverse food group category followed by Central Luzon (79.5%) and Western Visayas (77.2%). On the contrary, ARMM (4.8%) had the highest rates of households who consumed only one to four food groups in a week, followed by MIMAROPA and Eastern Visayas (both at 3.7%) and Northern Mindanao (3.3%). ARMM also lagged behind in terms of the number of households consuming nine to twelve food groups at only 37.5%.

Table 12. Percent distribution of households by dietary diversity score: Philippines, 2015

Region	n	Dietary Diversity Score Category		
		1 to 4 Group	5 to 8 Group	9 to 12 Group

Caraga	1,921	1.3	29.8	69.0

Figure 10 shows the DDS per region. Wealth or economic status of a household is directly proportional to diverse diet; as the wealth category of a household increases, household diet becomes more diverse. In the Philippines, the poorest households had a mean dietary diversity score of 8.4; middle-income households scored an average of 9.4, while the richest households had the highest mean dietary diversity score of 10.2.

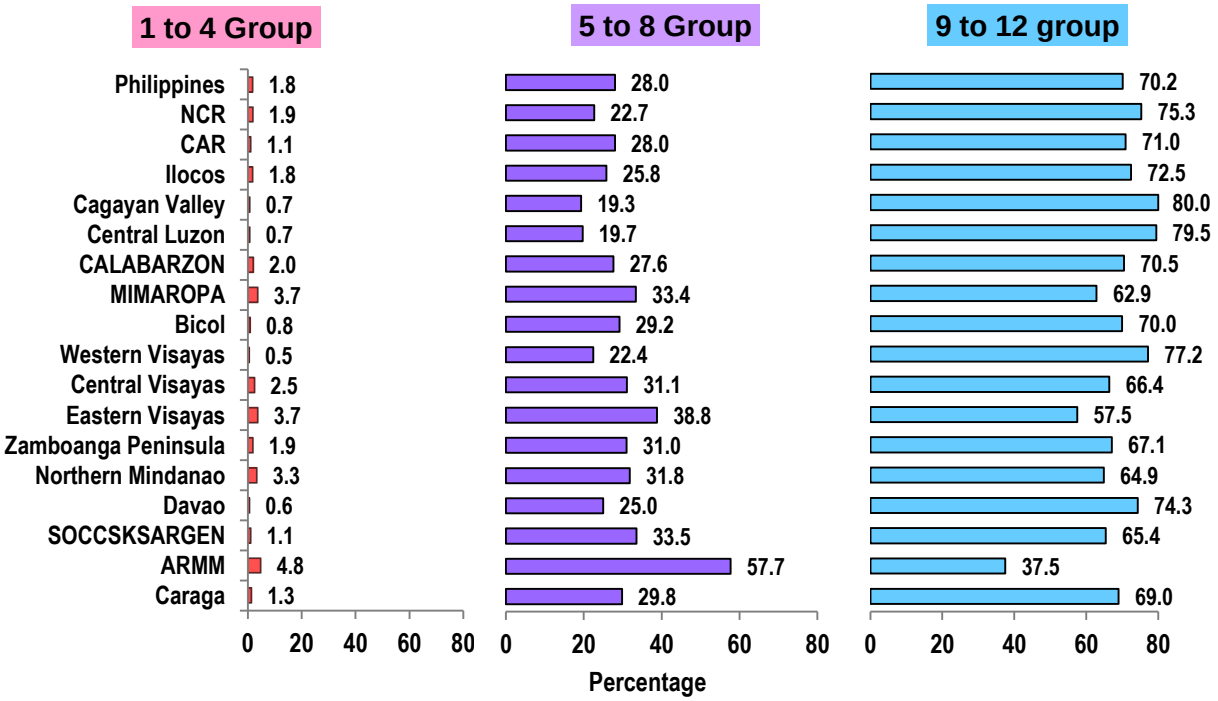

Figure 10. Percent distribution of households by dietary diversity score: Philippines 2015

The mean dietary diversity score between middle-income households and the rich differed only by 0.3 points, while the average national dietary diversity scores between the middle-income households and the poor differed by 0.4 points (Figure 11). Because household income directly affects the dietary diversity of a household, families that belong to low income groups had a higher risk of becoming undernourished because they were unable to gain access to a wider range of food groups and had lower diet quality.

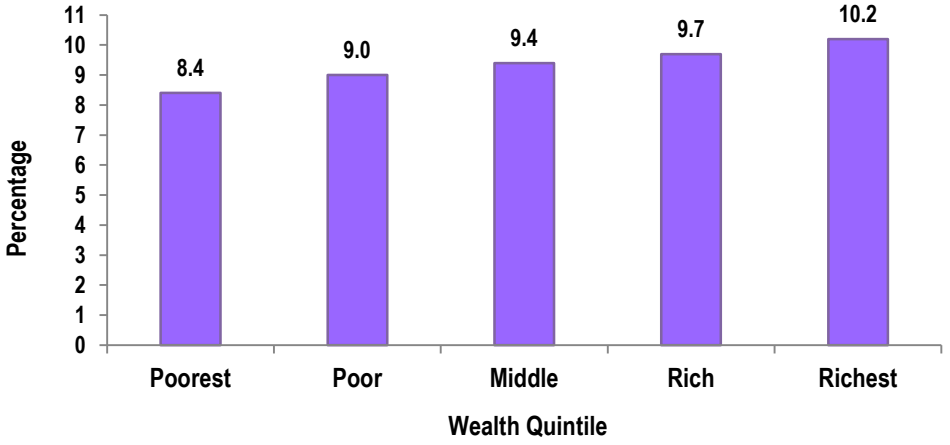

Figure 11. Mean dietary diversity score of households by wealth quintile: Philippines, 2015

Food Consumption Score

To assess a household's food consumption, the identified meal planner of the particular household was interviewed by food recall. Questions such as the type and frequency of food eaten by the household, how often in a week these food groups were consumed, as well as how and where these food groups were acquired was asked from the respondent. In the calculation of the FCS, nine food groups were weighed according to nutritional density (WFP, 2008).

In the Philippines, the most consumed food groups were the staples (99.8%), which includes rice, noodles, bread, biscuits, cookies, cereals and cereal products, rice products, and tubers such as cassava, potatoes, sweet potatoes, yam, and other starchy root crops. Meat and fish are the second most consumed food group (98.8%) followed by vegetables (97.9%), condiments (95.8%), and oil (90.4%). The least consumed food groups were milk (50.9%) and pulses (39.7%) (Figure 12).

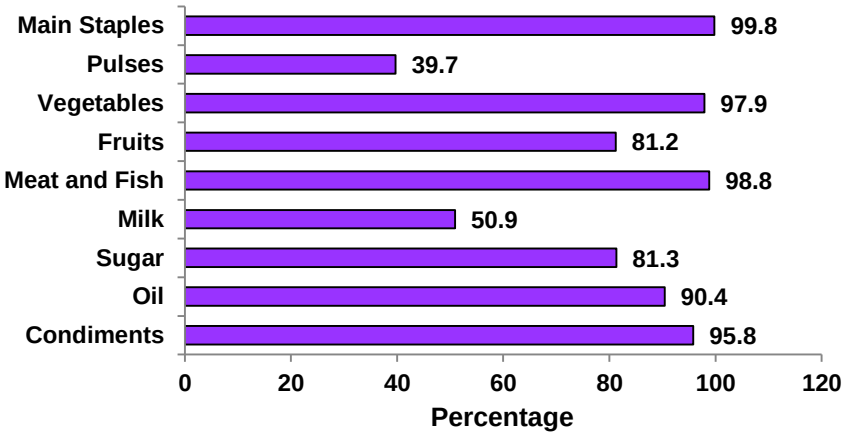

Figure 12. Proportion of households by intake of nine (9) food groups: Philippines, 2015

Table 13 shows the proportion of households consuming the nine food groups per region. Main staples, vegetables, meat and fish, oil, and condiments were consumed by the larger part of the population, while fruits and sugar products were eaten around four to six days per week (Table 14).

In general population, pulses were the least consumed food group in the Philippines, but among regions, more than half (57.5%) of households in Cagayan Valley incorporated this food group in their weekly diet. NCR (62.1%) had the highest number of households who consumed milk while ARMM had the lowest consumption of the said food group (17.2%) (Table 13).

Almost every Filipino household consumed vegetables as part of their daily diet; however, households in ARMM (87.7%) consumed this food group the least. Fruits were also consumed the least in ARMM (66.7%) and in Eastern Visayas (67.9%). Cagayan Valley had the highest percentage of sugar consumers (91.0%), while oils were consumed almost daily by households in Central Luzon (94.8%) and Western Visayas (94.1%) (Table 13).

Procurement of Foods by Region

The most common means of acquiring food by all households was through purchasing from local markets, groceries, and stores, if not taken from own food production. The top five food groups that were typically bought were spices (98.5%), oils and sweets (both at 98.4%), milk and other dairy products (98.1%), eggs (93.7%), and fish (92.2%). Legumes and pulses (91.9%), and meat (91.5%) were also obtained mostly by purchasing (Table 15).

Table 15. Percent distribution of households by sources of the 16 food groups: Philippines, 2015

Food Group	Purchased/Bought	Own Produce	Given/Free	Others
Cereals	87.4	9.3	1.9	1.5
Vitamin A-Rich Vegetables & Tubers	83.7	10.8	4.8	0.8

The Philippines abound with fertile soil and natural resources, that is why easily-grown crops are commonly seen in most household's backyards and gardens. As such, food groups like green leafy vegetables were obtained by almost half (46.0%) of Filipino households through own production, followed by crops such as Vitamin A-rich fruits (31.6%), other vegetables (21.0%), other fruits (19.4%), and white tubers (15.4%) (Table 15). Cagayan Valley has the country's highest percentage of households consuming their own produce of green leafy vegetables (70.7%) (Table 19) and Vitamin A-rich fruits (55.5%) (Table 21), while CAR was the top region for being both consumer and producer of other vegetables (37.9%) (Table 20), MIMAROPA for other fruits (36.6%) (Table 22), and Zamboanga Peninsula for white tubers (31.1%) (Table 18). Figure 13 shows the distribution of households and their sources of the sixteen food groups.

Figure 13. Percent distribution of households by source of foods consumed: Philippines, 2015

Tables 16 to 31 show sources by which each of the sixteen food groups were acquired by households in every region. The following are most common ways by which foods were obtained by households: a.) buying from stores, groceries, and markets; b.) production of own crops, products, and livestock; c.) given free from neighbor's surplus production, or as gift; and, d.) other means such as food aid, etc.

Cereals and cereal-based products are consumed by almost all households in the Philippines. One food item that is notably the most consumed in this food group is rice, which is a staple of a typical Filipino diet. Table 16 showed that most households obtained this food group through purchase, but in some regions, a fair percentage of households consumed rice from their own produce. These regions include Cagayan Valley (25.3%), CAR (24.1%), Western Visayas (19.4%), and Zamboanga Peninsula (19.0%) (Table 16).

Table 16. Percent distribution of households consuming cereals by source and region: Philippines, 2015

Caraga	1,916	88.5	8.9	1.3	1.3

Vitamin A – rich vegetables and tubers are some of the easily-grown crops among areas with plenty of arable land. The regions of Zamboanga Peninsula (26.3%), CAR (25.1%), ARMM (24.0%), and SOCCSKSARGEN (20.1%) had highest percentages of households whose consumption of this food group came from their own produce. On the other hand, households in urbanized areas like NCR (97.0%), rapidly-developing areas like CALABARZON (92.4%), and areas that specialize in other crops like Central Luzon (90.8%) vastly obtained vitamin A-rich vegetables and tubers through purchase due to lack of production area, thus increasing the need to source from other provinces (Table 17).

Table 17. Percent distribution of households consuming Vitamin A-rich vegetables and tubers by source and region: Philippines, 2015

Region	n	SOURCE			
		Purchased/Bought	Own Produce	Given/Free	Others

White tubers and roots are hardy crops which are fairly easy to grow and often serve as a cheap source of carbohydrates. The regions of Zamboanga Peninsula (31.1%), MIMAROPA (30.2%), Caraga (29.5%), ARMM (28.4%), Eastern Visayas (28.0%), SOCCSKSARGEN (27.5%), Cagayan Valley (26.6%), and CAR (26.0%) have the highest proportion of consuming households who sourced their supply of white tubers and roots from own production (Table 18).

Table 18. Percent distribution of households consuming white tubers and roots by source and region: Philippines, 2015

Region	n	SOURCE			
		Purchased/Bought	Own Produce	Given/Free	Others

Fairly high percentages of households in most regions produce their own source of dark green leafy vegetables. An exception was seen in the region of NCR where only 8.3% of households consumed leafy vegetables from their own gardens/backyards (Table 19). This is likely due to lack of arable land or gardening spaces among highly urbanized areas.

Table 19. Percent distribution of households consuming dark green leafy vegetables by source and region: Philippines, 2015

For Vitamin A-rich fruits, more than half, or 55.5% of households in Cagayan Valley obtained this food group from their own production. The region of Cagayan Valley also has the highest percentage of households who consumed vitamin A-rich fruits that were given free, typically from friends and neighbors. On the other hand, NCR had the lowest percentage of households who consumed vitamin A-rich fruits from own production at only 3.5% (Table 21).

Consumed spices, condiments, and beverages were obtained by 98.5% of Filipino households nationwide through purchase. In the Cordillera Administrative Region, 4.6% of households obtained it from own production; this proportion being the highest among regions. There were also 1.4% of households in the aforementioned region who obtained their source of spices, condiments, and beverages for free (Table 31). The Cordillera Administrative Region is famous for producing coffee and various fruit wines which explains why the area is more likely to be self-sustaining in terms of obtaining spices, condiments, and beverages for own consumption.

Frequency of Consumption

Tables 32 to 47 present the frequency of consumption of the 16 food groups in each region. The food groups that were eaten by most households everyday were cereals, beverages, spices, and condiments.

Cereals were regularly consumed by most households in Western Visayas (98.6%) and Central Luzon (98.1%) (Table 32). Although majority of households purchase their own supplies of cereal and similar products in both Western Visayas and Central Luzon regions, Western Visayas had more households who rely on their own produce as food supply (19.4%) than in Central Luzon (7.7%) (Table 16). Along with Cagayan Valley, these two regions are among the top three rice-producers in the country, with Central Luzon as the leading producer having a volume of 3,765,150 metric tons production[3], followed by Cagayan Valley (2,514,934 metric tons), and Western Visayas (2,052,574 metric tons) as of 2014.

[3] Philippine Statistics Authority: Major Crops Statistics of the Philippines, 2010-2014

White tubers are also among the country's top produce and an essential ingredient to most native delicacies. Sometimes, white tubers serve as a cheaper rice substitute and are utilized by some households when access to rice is limited. Majority of households in the Philippines incorporate white tubers in their diet two to three times a week at most (Table 34). Among regions, ARMM had the most households who consumed white tubers (10.2%), and among these consumers, 28.4% sourced their white tubers from own production. This is expected as ARMM is the region which produces the greatest volume of cassava[4].

Another product widely utilized in the Philippines is the sugar cane, processed into sugars and sweets, which were consumed by most households regularly. Despite being a major crop in Western Visayas[5] and most regions in the Philippines, results of the survey showed that this food group was often acquired through purchasing. This is because sugar cane still need to undergo processing to obtain its consumable form.

Among the 16 food groups, organ meats, white tubers, vitamin-A rich fruits, and legumes were consumed the least on a weekly basis.

Food Consumption Categories

Based on a cut-off score of 42[6], a vast majority of Filipino households had acceptable food consumption. This indicates food security in terms of variety and nutritional adequacy. However, ARMM had the highest rates of households with borderline (22.6%) and poor (6.5%) food consumption compared with other regions (Figure 14 and Table 48). MIMAROPA comes next to having the highest rates of households with poorly-diverse diets at 5.0%.

[6] The threshold of 42 was established through research conducted in other, mostly African countries.

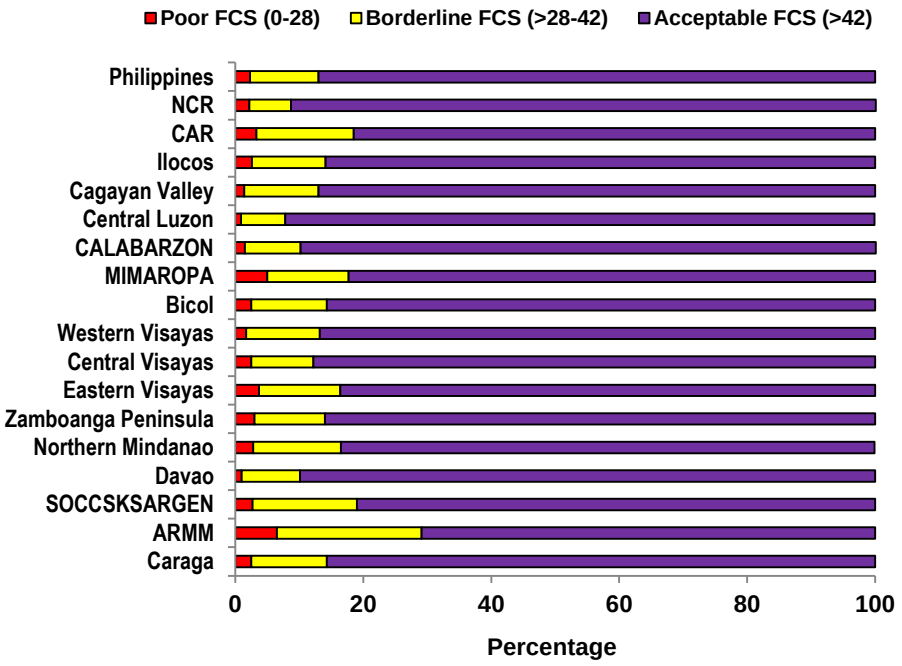

Figure 14. Percent distribution of households by food consumption category per region: Philippines, 2015

The wealth quintile in which a household belongs also affects its dietary diversity; as the household's wealth category increases, the more diverse the diet becomes. More households within the acceptable food consumption category were found among middle-income to the richest households, while households with the most number of poor food consumption were found among the poorest wealth categories (Figure 15). Despite having lower than average income, poor households mostly have acceptable food consumption at 83.2% than borderline (14.4%) or poor (2.5%) food consumption.

Table 48. Percent distribution of households by food consumption category per region: Philippines, 2015

Region	n	Poor (0-28)	Borderline (>28-42)	Acceptable (>42)
Philippines	**40,893**	**2.3**	**10.7**	**87.0**
NCR	3,213	2.2	6.5	91.4
CAR	1,706	3.3	15.2	81.5

ARMM	1,727	6.5	22.6	70.9
Caraga	1,921	2.5	11.8	85.7

Figure 15 shows that majority of Filipino households have acceptable food consumption even among the poorest. The rich (93.8%) and the richest (96.8%) quintiles have the country's largest proportion of households with acceptable food consumption. Meanwhile, the poorest (21.8%) and the poor (14.4%) have the most number of households with insufficiently diverse diets, or borderline food consumption (Figure 15).

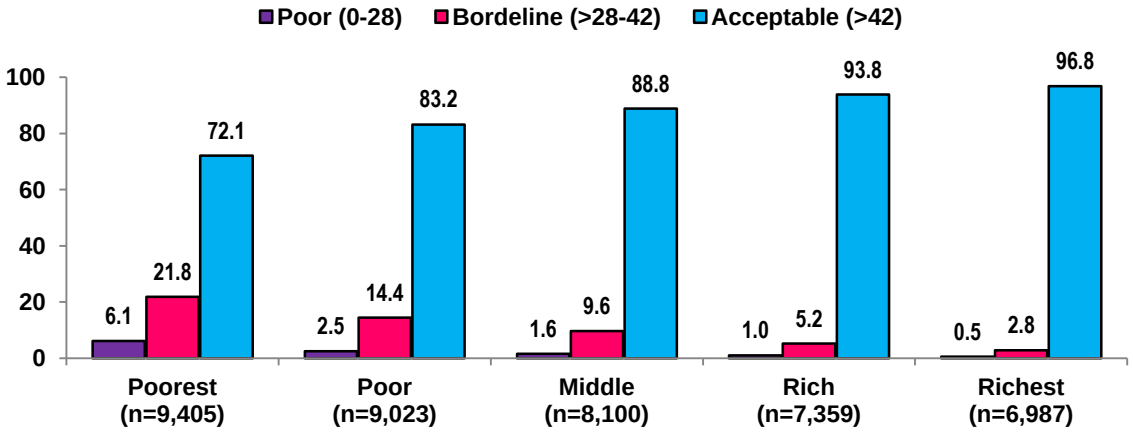

Figure 15. Percent distribution of households by wealth quintile and food consumption category: Philippines, 2015

Table 49 shows that the highest percentage of households with poor food consumption was observed among the poorest in the regions of NCR (16.5%) and MIMAROPA (13.9%). On the other hand, middle-income households have generally acceptable (88.8%) food consumption, which suggests that Filipino households with even an average purchasing capacity could sustain having a well-diverse diet (Table 51).

CONCLUSIONS AND IMPLICATIONS

The results of the 2015 Updating Survey presented in this monograph lead to the following conclusions:

- Only one out of three, or 33.9% Filipino households were found to be food secure. There was a slight decline of 0.2% compared with the values obtained in 2013.

- Among the regions, CALABARZON had the most percentage of food secure households (44.4%), followed by Central Luzon (43.3%) and Cordillera Administrative Region (39.3%). On the other hand, the Autonomous Region of Muslim Mindanao (ARMM) had the least number of food secure households (15.0%).

- An increasing trend was observed in the percentage of households considered food secure from 15.6% in 2001 to 33.9% in 2015. However, the increase was inadequate since majority of households or two-thirds of the population still suffers from food insecurity.

- About 37.8% of households with less than or equal to five members were considered more food secure (p-value $\leq$0.05) compared to households with more than five members (25.9%). Thus, household size significantly affects food security status.

- Households with female heads were significantly more food secure (38.5%) compared to households headed by males (32.6%) (*p*-value $\leq$0.05).

- Food insecurity and wealth quintile had an inverse relationship. Households belonging to the richest quintile have the largest proportion of food secure households (71.6%), while those belonging to the poorest quintile have the smallest ratio at 11.5%.

- Majority of households in all regions consumed nine to 10 different types of food groups each week, which depicts good diversity in the Filipino diet. Cereals (99.7%), vegetables (97.9%), condiments and beverage (95.8%), fish and other seafood (90.8%), and oils and fats (90.4%) comprise the largest bulk of a typical Filipino diet.

- Filipino households sourced their food mainly through purchasing or buying, followed by own-production. Hence, purchasing capacity of the household greatly affects food security status.

- Green leafy vegetables (46.0%), vitamin A-rich fruits (31.6%), and other vegetables (21.0%) are the food groups with the highest proportion of households who obtain their supply from own produce.

- Almost all households in all regions were classified to have an "Acceptable" food consumption level which indicates food security in terms of dietary diversity and nutritional adequacy.

The generally acceptable food consumption scores and wide variety of food groups eaten in a week by most households in majority of the regions in the Philippines indicate a fair level of food security in the country. However, energy needs are still insufficiently met, and some households still experience severe levels of food insecurity. It is also possible that the tools used to asses these parameters may need to be modified to fit the Philippine setting better, as these tools were initially applied by researchers in the African population, therefore some factors may not have been classified appropriately.

The Philippines, admittedly, has a long way to go when it comes to improving food security. Although there was a notable increase in the number of food secure households over the years, the rate of growth was not enough to completely eradicate hunger by the end of the Millennium Development Goal deadline. Programs that are aimed to improve food security should be amplified and highly vulnerable areas such as the regions of ARMM and parts of Visayas and MIMAROPA, as well as populations in the lowest wealth categories should be given utmost priority. With sufficient, timely, and properly-addressed interventions, among other factors, complete food security in the country can be fully achieved.

Surigao del Sur	447	21.9	2.5	17.4	27.2	11.4

[7] National Capital Region includes all the four districts and cities therein
District I – Manila
District II – Quezon City, Mandaluyong, Marikina, Pasig, San Juan
District III – Caloocan, Malabon, Navotas, Valenzuela
District IV – Makati, Pateros, Taguig, Las Piñas, Parañaque, Pasay

[8] Although administratively Isabela City is the capital province of Basilan, it is not part of the ARMM and is placed under Zamboanga Peninsula region. However, in generating provincial estimates, the city is included in the province of Basilan

[9] Cotabato City is the regional center of ARMM but the city is actually part of SOCCSKSARGEN and does not belong to ARMM. Thus, in generating provincial estimates, Cotabato City is classified under the province of North Cotabato.

[10] Excluding the cities of Isabela and Cotabato

[11] Including the City of Isabela

Surigao del Sur	447	19.0	3.3	13.4	26.2	17.2

[7] National Capital Region includes all the four districts and cities therein
District I – Manila
District II – Quezon City, Mandaluyong, Marikina, Pasig, San Juan
District III – Caloocan, Malabon, Navotas, Valenzuela
District IV – Makati, Pateros, Taguig, Las Piñas, Parañaque, Pasay

[8] Although administratively Isabela City is the capital province of Basilan, it is not part of the ARMM and is placed under Zamboanga Peninsula region. However, in generating provincial estimates, the city is included in the province of Basilan

[9] Cotabato City is the regional center of ARMM but the city is actually part of SOCCSKSARGEN and does not belong to ARMM. Thus, in generating provincial estimates, Cotabato City is classified under the province of North Cotabato.

[10] Excluding the cities of Isabela and Cotabato

[11] Including the City of Isabela

Surigao del Sur	446	2.5	12.9	84.6

[7] National Capital Region includes all the four districts and cities therein
District I – Manila
District II – Quezon City, Mandaluyong, Marikina, Pasig, San Juan
District III – Caloocan, Malabon, Navotas, Valenzuela
District IV – Makati, Pateros, Taguig, Las Piñas, Parañaque, Pasay

[8] Although administratively Isabela City is the capital province of Basilan, it is not part of the ARMM and is placed under Zamboanga Peninsula region. However, in generating provincial estimates, the city is included in the province of Basilan

[9] Cotabato City is the regional center of ARMM but the city is actually part of SOCCSKSARGEN and does not belong to ARMM. Thus, in generating provincial estimates, Cotabato City is classified under the province of North Cotabato.

[10] Excluding the cities of Isabela and Cotabato

[11] Including the City of Isabela

Appendix 21. Household Food Security Questionnaire

2015 UPDATING FORM 1.5 – HOUSEHOLD FOOD SECURITY (Household Food Insecurity Access Scale)

AREA CODE (Copy from NNS Form 1.1) | | |

(Continuation…..)			
5. In the past month, did you or any household member have to eat a smaller meal than you felt you needed because there was not enough food? If yes, how many times in the past month? *"Noong nakaraang buwan, ikaw ba o kahit sino sa inyong pamilya ay nakaranas kumain ng mas kakaunti kaysa sa karaniwang dami ng inyong kinakain dahil sa kakulangan ng pagkain?"* *Kung oo, gaano kadalas ito ng nakaraang buwan?*	FDSEC05	0 – No 1 – Yes, rarely (1 – 2 times) 2 – Yes, sometimes (3 - 10 times) 3 – Yes, often (more than 10 times)	
6. In the past month, did you or any other household member have to eat fewer meals in a day because there was not enough food? If yes, how many times in the past month? *"Noong nakaraang buwan, ikaw ba o kahit sino sa inyong pamilya ay nakaranas na kumain ng 1 hanggang 2 beses lamang sa loob ng isang araw dahil sa kakulangan ng pagkain?"* *Kung oo, gaano kadalas ito ng nakaraang buwan?*	FDSEC06	0 – No 1 – Yes, rarely (1 – 2 times) 2 – Yes, sometimes (3 - 10 times) 3 – Yes, often (more than 10 times)	
7. In the past month, was there ever no food to eat of any kind in your household because of lack of resources to get food? If yes, how many times in the past month? *"Noong nakaraang buwan, may pagkakataon ba na walang makain nang kahit anong uri ng pagkain ang inyong pamilya dahil walang pagkukunan nito?"* *Kung oo, gaano kadalas ito ng nakaraang buwan?*	FDSEC07	0 – No 1 – Yes, rarely (1 – 2 times) 2 – Yes, sometimes (3 - 10 times) 3 – Yes, often (more than 10 times)	
8. In the past month, did you or any household member go to sleep at night hungry because there was not enough food? If yes, how many times in the past month? *"Noong nakaraang buwan, ikaw ba o kahit sino sa inyong pamilya ay natulog nang gutom (o di naghapunan) dahil kulang ang pagkain?"* *Kung oo, gaano kadalas ito ng nakaraang buwan?*	FDSEC08	0 – No 1 – Yes, rarely (1 – 2 times) 2 – Yes, sometimes (3 - 10 times) 3 – Yes, often (more than 10 times)	
9. In the past month, did you or any household member go a whole day and night without eating anything because there was not enough food? If yes, how many times in the past month? *"Noong nakaraang buwan, ikaw ba o kahit sino sa inyong pamilya ay hindi kumain nang buong araw hanggang gabi dahil kulang ang pagkain?"* *Kung oo, gaano kadalas ito ng nakaraang buwan?*	FDSEC09	0 – No **(Questionnaire is finished)** 1 – Yes, rarely (once or twice in the past month) 2 – Yes, sometimes (three to ten times in the past month) 3 – Yes, often (more than ten times in the past month)	

Adapted from the Household Food Insecurity Access Scale developed by the U.S. Agency for International Development's (USAID's) Food and Nutrition Technical Assistance (FANTA)

Appendix 22. Household Dietary Diversity and Food Frequency Questionnaire

2015 UPDATING FORM 1.6 – HOUSEHOLD DIETARY DIVERSITY AND FOOD FREQUENCY

Ask the meal planner of all the foods and drinks served/prepared to the household members for the last 7 days (during the past week) **for each food group category. (Note for enumerator: exclude foods eaten outside the home)**

1. Ask the meal planner if they **consume** foods belonging under each food group listed below for the last 7 days.
   "Anu-anong pagkain ang hinahanda o nakonsumo ng miyembro ng pamilya na kasali sa bawat grupo ng pagkain na nakalista sa ibaba noong nakaraan 7 araw."
2. Then ask **how many days in the past week** the food item has been served.
   "Ilang araw sa nakaraang linggo hinanda o kinain ang pagkain?"
3. If there were two or more food items served under one food group ask what is the food that was **served the MOST** during the past week?
   "Alin sa mga nabanggit na pagkain sa bawat grupo ang pinakamadalas na kainin noong nakaraang linggo?"
4. Ask what is the **source** of the food item that was served the MOST?
   "Saan nanggaling o binili ang pagkain na madalas ihanda o nakonsumo?"

CODE	FOOD GROUP	EXAMPLES	CONSUMPTION CODE 0 - No 1 - Yes	ACTUAL NO. OF DAYS FOOD CONSUMED IN THE PAST WEEK	SERVED THE MOST (FOOD ITEM)	SOURCE CODE
1	CEREALS AND PRODUCTS	Rice, bread, noodles, biscuits, cookies or any rice and cereal products *like biko, suman (malagkit), puto, noodles/pasta, porridge (arrozcaldo, champorado)and others*				
2	VITAMIN A RICH VEGETABLES AND TUBERS	carrots, squash, sweet potatoes that are yellow or orange inside				
3	WHITE TUBERS AND ROOTS	white potatoes, potato, cassava, yacon, tugi or foods made from roots like *French fries, pitsi-pitsi, bibingka, camote cue etc.*				
4	DARK LEAFY GREEN VEGETABLES, INCLUDING WILD ONES	dark green, leafy vegetables, such as*camote tops, kangkong, malunggay, cassava leaves etc.*, including wild ones like*pako and others*				
5	OTHER VEGETABLES INCLUDING WILD VEGETABLES	*Eggplant, sitao, ampalaya* and other wild vegetables like *rattan shoot, bamboo shoots and others*				
6	VITAMIN A RICH FRUITS	ripe mangoes, papayas, *guava, melon, passion fruit, dragon fruit and others*				
7	OTHER FRUITS, INCLUDING WILD FRUITS	like banana, *guyabano,* Star apple, *chico, atis*and wild fruits like sapinit (wild raspberry), *bangkoro, bignay and others*				
8	MEAT, FRESH AND PROCESSED	fresh like beef, pork, lamb, goat, rabbit, chicken, duck, or other birds, wild game, boar, snake, turtle; processed meat like hotdog, *tocino, longanisa and others*				
9	ORGAN MEATS (IRON-RICH)	liver, kidney, heart or other organ meats or blood-based foods like dinuguan, isaw (chicken/pork), bopis, sisig and others				
10	EGGS	Any eggs, fresh and salted				
11	FISH AND SHELLFISH	Fresh, dried, processed, like sardines, tuyo, tinapa, alamang and others				
12	LEGUMES, NUTS AND SEEDS	*beans, peas, lentils, nuts, seeds* or foods made from these like *pork and beans, guisantes de lata, tokwa, tofu and others*				
13	MILK AND MILK PRODUCTS	milk (fresh, canned milk, powder) and products like cheese, yogurt, ice cream, leche flan and others				
14	OILS AND FATS	oil, fats or butter added to food or used for cooking				
15	SWEETS	sugar, candies, honey, sweetened soda, sugary foods like chocolates and others				
16	SPICES, CONDIMENTS, BEVERAGES	Pepper, salt, *knorr seasoning* condiments like *vetsin*, soy sauce, hot sauce, coffee, tea, alcoholic beverages like *Tanduay, Emperador*, San Miguel product, locally made like *basi, tuba, lambanog, vino kulafu and others*				

***Actual Number of Days Code**
1 – One day
2 – Two days
3 – Three days
4 – Four days
5 – Five days
6 – Six days
7 – Seven Days
9 – Not applicable (No consumption)

****Source Code**
1 – Purchase/bought
2 – Own produce
3 – Not own produced, but hunted, fished, gathered (wild plants and animals)
4 – Borrowed
5 – Exchanged for labor (Food for work)
6 – Barter
7 – Received as gift
8 – Food aid
9 – Given/Free
99 – Not Applicable

*****Served The Most Code**
9 – Not Applicable (No Consumption)
